

## Web Work Works in Northern Saskatchewan

Mining in Northern Alberta & Saskatchewan is one of Canada's largest industries. It provides thousands of jobs and billions of dollars in commerce. Snake Lake Construction is one of the leading general contractors in this region and owns and operates millions of dollars in rolling equipment.

When Snake Lake Construction went looking for an Asset Maintenance system, they chose to partner with Web Work by Tero, a company which for 30 years has been implementing, supporting and integrating CMMS (Computer Maintenance Management System) software.

*"Our staff love it (Web Work) for many reason," explains Garnet Senger, Sr. Project Manager. "New computer software can be overwhelming, but once they figured out how easy it was for them, they started to appreciate what it can do. We have now come to see what the benefits of the Web Work software is doing for us"*

Snake Lake Construction utilizes Web Work's many maintenance features to eliminate downtime. It is vital to ensure maximum operating efficiency by scheduling maintenance activities around asset availability. The maintenance coordinators rely on Web Work's advanced planning and scheduling component to effectively plan manpower and asset maintenance activities. All material and labour costs are tracked in detail for analyzing expense and asset value.

Snake Lake Construction chose Web Work's hosted solution to ensure they have immediate access to their work data base system anywhere at any time.

Future additions to the Web Work system for Snake Lake Construction will include an interface to a GPS asset location system.
